**Abstract.** Incongruity resolution is one of the most widely accepted theories of humour, suggesting that humour is due to the mixing of two disparate interpretive frames. In this paper, we explore several computational models for incongruity resolution. We consider a new class of constraints, a series of “chase” experiments for a punch line, and its resolution by four possible coherent continuations out of which only one has a comic effect. Using this data set, we explore the task of the automatic identification of the humorous punch line among all the plausible endings. We explore several new sets of semantic relationships, along with a number of fine-grained features, and try to understand their effectiveness as computational models for incongruity detection.

#### 1 Introduction

Humour is one of the most interesting and puzzling aspects of human behaviour, and it is rightly believed to play an important role in an individual’s development, as well as in interpersonal communication. Research on this topic has received a significant amount of attention from fields as diverse as linguistics, philosophy, psychology and sociology, and recent years have also seen attempts to build computational models for humour generation and recognition.

One of the most widely accepted theories of humour is the incongruity theory, which suggests that humour is due to the mixing of two disparate interpretive frames in one statement. One of the earliest references to an incongruity theory of humour is due to Aristotle [1], who found that the contrast between expectation and actual outcome is often a source of humour. The theory also found a supporter in Schopenhauer [2], who emphasised the element of surprise by suggesting that “the greater and more unexpected [...] the incongruity is, the more violent will be [the] laughter”.

In more recent work in the field of linguistics, the incongruity theory has been formalised as a necessary condition for humour and used as a basis for the Semantic Script-based Theory of Humour (SSTH) [10] and the General Theory of Verbal Humour (GTVH) [12].
